

Frog Life Cycle Craft

Bullfrogs are a part of a group of animals called AMPHIBIANS. Amphibians are animals with backbones that start their lives in water, but soon grow up to live on land. When baby frogs are born, they go through a whole transformation from egg to adult! Baby frogs, called tadpoles, start their lives breathing through their gills, but as they get older, they breathe air through their lungs.

They start with a tail but soon grow legs instead! Amazing!

Color the pictures of the different stages the frogs go through, then carefully cut them out.

Paste the pictures on the lily pad on the following page in the order of their life cycle.
